

AMENDMENTS TO THE SPECIFICATION

Please replace Paragraph [0064] with the following paragraph rewritten in amendment format:

With reference to Figure 3A and additional reference to Figure 1, a construct 80 that may be implanted in an imageless manner in a spine to rigidly fix relative vertebrae is shown. The construct 80 generally includes a plurality of first members or pedicle screws 82 that may be implanted into a selected vertebrae as is known in the art. The first members, however, may be a fastener of any appropriate type. The screw 82 generally includes a head portion 84 and a threaded portion 86. The threaded portion 86 is generally adapted to threadably engage a selected boney portion and be held therein. The head portion 84 is formed to removably receive a localization element, further described herein and may also be formed to operably engage a connector 88. In this regard the screw 82 includes or defines a slot 90 that is operable to slidably receive the connector 88. Also, the head portion 84 may be moveable or pivotable relative to the threaded portion 86. Thus, the screw 82 may also be a multi-axis screw. The screw 82 may also define a ~~cannular~~ cannula 91 through the screw. Therefore, the screw 82 may be positioned over a guide wire or K-wire that has fitted into a selected position, such as pedicle to assist in positioning the screw 82 thereto. Nevertheless, the screw 82 need not be cannulated and need not include the ~~cannular~~ cannula 91, therefore, the ~~cannular~~ cannula 91 is optional.
